Following the publication of the original article [1], we were notified that the primary endpoint was incorrectly described as being assessed at 24 months post-randomization. However, the correct time point for the primary endpoint, as outlined in the ethically approved study protocol document, is 12 months post-randomization.

This error has only come to light upon the trial's completion due to the length of time that has elapsed since ethical approval, trial registration, the development of the statistical analysis plan, and the publication of the study protocol.

The original article has been corrected.
